UNIVABIO | ARTIFICIAL INTELLIGENCE FOR HUMAN HEALTH

MedWatch

A clearer story between care visits.

The problem. Everyday changes can be hard to recall at an appointment. Older adults and family caregivers may arrive with disconnected notes and an incomplete picture of what was actually recorded.

Our approach. MedWatch turns a patient's own words into a reviewable daily record, then brings confirmed observations, caregiver concerns and a medication list into a concise visit brief.

01 Record	02 Confirm	03 Understand	04 Prepare
Describe the day	Check every suggestion	Follow the evidence	Review a visit brief

MEANINGFUL AI

A real language model runs locally in the browser. It extracts proposed form answers with exact source quotes, chooses fixed clarification prompts, summarizes records, answers bounded record questions, and drafts visit discussion notes. The full manual form remains available.

EVIDENCE AND HUMAN CONTROL

The app validates response structure, source identity, quoted spans and numerical support before showing a draft. Patients confirm source writes. Caregivers review report wording. Missing answers stay unknown, and observer notes stay separate from patient counts.

WORKING PROTOTYPE

React + TypeScript, local browser storage, WebGPU inference with WebLLM and Qwen2.5-1.5B. Includes role-specific screens, correction history, medication-list editing, descriptive charts, evidence drawers, pinned concerns, and review-required PDF printing.

IMPACT AND HONEST LIMITS

The intended benefit is less recall burden and better visit preparation. Health outcomes and human usability have not been measured. This is a fictional-data student prototype: no diagnosis, dosing advice, risk scoring, triage, clinician monitoring, or claim of regulatory clearance.

Development evidence, not clinical validation

Automated checks cover record logic, persistence, role controls, responsive screens and printing. Real-model synthetic results are logged separately. Source-explanation AI is gated pending qualified content review.

Submission includes source code and a working local demo. | MedWatch is a working project name.
